

Digital broadcasting, from my viewpoint, is not necessary. On AM, it knocks out signals from about 30 kHz either side of the main carrier. On FM, adjacent channels are obliterated as well, causing loss of reception of these stations for people interest in the programming of these stations.

The small difference of 5 kHz or so in audio range over analog FM won't be noticed by most people. I feel iBiquity is jamming this down the throats of the American public, causing confusion and problems as well. Most people are happy with things as they are and do not need digital broadcasting and the eventual obselescence of their radios.

Thank You for considering my comments.
